ProxyScout — Core function test cases for Edge on Android

Extension ID on Edge Add-ons: `fmgnnkkdafjkkdfbohbgcgpblondogon` · Source code: github.com/Halil-KAPLAN/ProxyScout (GPL-3.0) · Prepared 27 October 2026

Test environment

Device	Xiaomi POCO F2 Pro, Android 12 (real device, Wi-Fi)
Browser	Microsoft Edge Canary 158.0.4362.0 for Android
Extension version	1.2.2, and a pre-release build of 1.2.3 with the reconnect fix (results below note which build)
Installation	Edge Canary → Settings → About Microsoft Edge → tap the version 5 times → Developer options → "Extension install by crx"
Exit IP check page	`https://api.ipify.org` (shows the public IP address a website sees)

Test cases

ID	Function	Steps	Expected result	Result
TC1	Install and open the manager	1. Install ProxyScout.	The ProxyScout manager page opens in a new tab; the layout fits the phone width without horizontal scrolling.	Pass
TC2	Open the popup	1. Edge menu → Extensions → ProxyScout.	The popup opens full screen with the connection card, the proxy tabs and the "Download & test" button.	Not yet run on Edge (Pass on Firefox for Android)

TC3	Download and test proxy lists	1. In the manager tap "Download & test lists". 2. Watch the progress bar and the counters.	Proxies are downloaded and tested; the counters (Total / Working / Dead) and the list update while the test runs; working proxies appear in the list.	**Pass** with the 1.2.3 fix (1.2.2: list updated only after reloading the page)
TC4	Connect to a proxy	1. Tap "Connect" next to a working proxy. 2. Open `https://api.ipify.org` in a new tab.	The connection card turns green and shows the proxy; the page shows the proxy's IP address, not the device's own IP.	**Pass**
TC5	Turn the proxy off	1. Turn off the switch at the top of the popup or the manager. 2. Reload `https://api.ipify.org`.	The card shows "Direct connection"; the page shows the device's own IP address again.	**Pass**
TC6	Re-test working proxies	1. "Test" → "Working proxies". 2. Watch the progress text for 40 seconds.	The progress text and counters keep updating for the whole run.	**Pass** (1.2.3 pre-release)

TC7	Settings on a phone	1. Tap the gear button next to "ProxyScout". 2. Switch between the "Settings" and "Sources" tabs. 3. Tap the gear again.	Settings opens with the extension version shown under the title; the Sources tab lists the proxy list sources; the second tap returns to the proxy list.	New in 1.2.3 (verified on Firefox for Android)

Version notes

1.2.2: phone layout for the manager and the popup (horizontal categories, always-visible Connect buttons on touch screens).
1.2.3: fewer list sources enabled by default (about 400–500 proxies per download), the version shown in Settings, Settings and Sources behind a gear button on narrow screens; the manager now reconnects to the background if its connection drops silently (found while testing on Edge for Android).

Notes: free public proxies change quickly, so the number of working proxies and the latency vary between runs. Sync between browsers uses Google Drive sign-in (chrome.identity). The extension collects no data and has no server of its own; see the privacy policy at halil-kaplan.github.io/proxyscout/privacy.html.
